# INTRODUCTION

This booklet is supplementary to the current 'Stratco Purlins & Girts Capacity Tables and Technical Information Span Table Book.' Standard Z and C section dimensions have been modified slightly to achieve increased design capacities and create the Stratco Maxi-Purlin System.

These capacity tables have been calculated in accordance with limit state design principles and comply with Australian/New Zealand standard AS/NZS 4600: 2005 Cold-Formed Steel Structures.

Tables have been generated using the latest version of the purlin software developed by the Centre for Advanced Structural Engineering at the University of Sydney.

The Stratco Maxi-Purlin Z & C sections range from 150mm through to 350mm in depth and design capacity tables have been generated for a comprehensive range of span configurations.

The Stratco Rapidfix bridging system is suitable for use with the Maxi-Purlin range with further details available from the 'Stratco Purlins & Girts Capacity Tables and Technical Information Span Table Book'.

If any further details are required on the Stratco Maxi-Purlin System and its capabilities please contact Stratco for advice.

# DESIGN AND SPECIFICATION DATA

## MATERIAL

Stratco purlins are manufactured from hi-tensile, zinc coated steel tested for compliance with AS1397 and have a minimum yield stress of 450MPa. Refer to the Maxi-Purlin Z & C Section Dimensions Table for individual mass and steel grades for each section.

## LAPPING

Stratco Maxi-Purlin Z Sections require a lap length of 15% of the span and must be bolted in the outer web hole closest to the sheeting and the inner flange hole at both ends of the lap as shown in Figure 1.

The lap length is the distance between the bolt hole centres at the end of the laps.

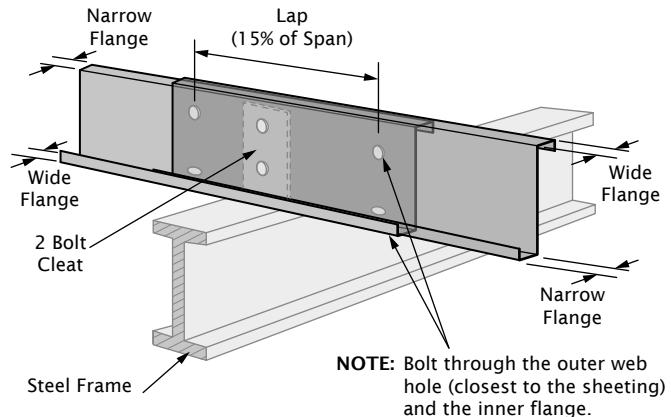

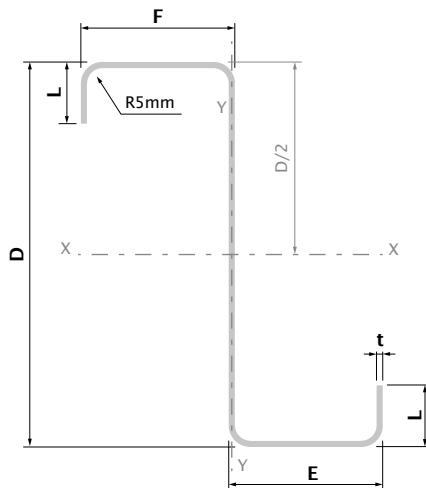

Figure 1

## BOLT SIZES

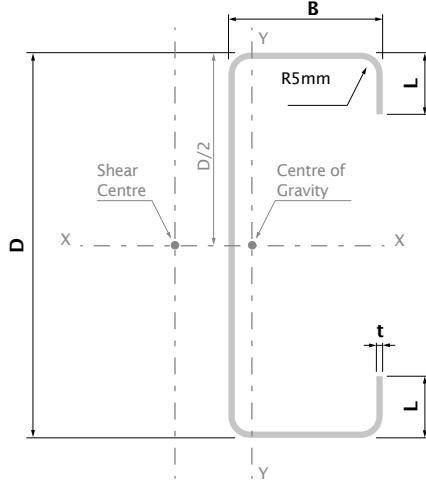

Bolting of section sizes from 150 to 250mm inclusive, at cleats and lapped joints, requires M12 grade 4.6 bolts to be used, 300 and 350mm sections require M16 grade 4.6 bolts.

If the shear capacity of the bolts is exceeded grade 8.8 bolts will be required and this is indicated by shading in the tables.

# ABOUT THE TABLES

## HOW TO USE STRATCO PURLIN AND GIRT TABLES

The design capacity tables indicate the maximum allowable limit state design uniformly distributed loads that can be applied to the sections. As the tables assume uniformly distributed loads, any point loading must be converted to uniformly distributed loads to enable the tables to be correctly used. Once the outward and inward loads on the members have been determined in accordance with the relevant standards, the appropriate table may be used to determine the best section sizes and bridging requirements. Linear interpolation is permitted for intermediate span values.

## ASSUMPTIONS

The Design Capacity Tables assume that sections are bent about the axis perpendicular to the web and there is continuity at any laps. It is also assumed sections are provided with lateral stability in the plane of the roof at internal supports and at the ends of cantilevers. In addition, these tables are based on the assumption that roofing and walling provide lateral restraint to the purlin flange to which it is attached and that there is restraint against twisting and lateral movement at the bridging points.

Where a section is not loaded to its full capacity the reserve capacity will allow it to resist forces other than bending, e.g. axial loading due to bracing of roof or wall structures. Sections subject to forces other than those inducing bending about the major axis must be designed in accordance with AS/NZS 4600.

It is important to ensure any construction loading is accounted for and care is taken during installation to avoid buckling or distorting the shape of sections as this can adversely affect performance. The tables do not take into account the ability of the roof or wall cladding to carry the published loads. Refer to relevant Stratco documentation on roofing and walling to determine cladding requirements.

## DEFLECTIONS

The values shown in the 'Def'n L/150' column are the uniformly distributed loads required to produce a maximum deflection of span/150. The deflection limit is applicable to both inward and outward load cases and loads for other deflection ratios may be obtained by simple proportion.

# DESIGN CAPACITY TABLES

Single spans are simply supported at each end of the purlin.

**NOTE:**  
Bolting of section sizes from 100 to 250mm inclusive requires M12 grade 4.6 bolts.  
300mm and 350mm sections require M16 grade 4.6 bolts.  
Shaded values require grade 8.8 bolts.

# 2 LAPPED

## DESIGN CAPACITY TABLES

**Two lapped spans** are continuous over two bays, supported at each end of the purlin and lapped over one internal support.  
(Tables in kN/m)

### NOTE:

Bolting of section sizes from 100 to 250mm inclusive requires M12 grade 4.6 bolts.  
300mm and 350mm sections require M16 grade 4.6 bolts.  
Shaded values require grade 8.8 bolts.

# DESIGN CAPACITY TABLES

**Cantilever spans** have the purlin cantilevered past the end frame of the building.

(Tables in kN/m)
